\*Mechanism of Electrical Erosion of a Metal. S. L. Mandel'shtam and S. M. Raisky (Izdat. Akad. Nauk SSSR, 1949, [Fiz.], 13, 519-565; C. 1950, 44, 3375). (In Russian). Erosion of electrodes, especially in a condensed spark discharge, is considered to be a secondary process and attributed to the mechanical action of metal vapour jets ("torches") formed by the discharge of high c.d., mostly from the cathode, which erode the anode. At low c.d. the process is reversed. Tests were made with a spark discharge between steel roller bearings in air. The spark energy was independent of the size of the gap. At small gaps the stream was high and the anode was more eroded, at larger gaps the erosion was less and stronger on the cathode. A conical cathode with a sharp point caused higher destruction of the anode than a round cathode. Electrodes of iron, aluminum, manganese and copper were investigated; copper caused the highest destruction of the opposite electrode. A quartz plate introduced in series to shield the "torches" without disturbing the discharge suppressed erosion considerably. To prevent the spreading of the "torches", one or both electrodes were placed in a cylinder and the jets directed on a cylindrical plate, which had no effect. In the conditions at high c.d. the jets were unstable and the anode broke on the introduction of a self-induction coil. Some physical characteristics present a critical minimum speed of at least 2 mm/sec. It is proposed that the erosion in spark discharge is produced by impact of a chemically active plasma on the anode.

164. Properties of an optical system incorporating a zone diaphragm. S. M. RAYSKIY, *Zh. eksp. teor. fiz.*, 25, No. 1(7) 95-7 (1953) In Russian.

It was shown in a previous paper [*Uspekhi fizicheskikh Nauk*, 47, 515 (1952)] that optical systems consisting of a lens (or mirror) and a zone plate have 3 bright foci, viz. one principal and two zone foci. This enables a sharp focusing of the image of 3 parts of an object (e.g. its front, middle and rear) to be effected in the plane of observation. By using a suitable zone plate it is possible to treble the sharpness of the image. Some peculiarities of the image observed and the conditions under which it can be obtained are described.

TITLE: A simple method for the separation of the channel and the flare of a spark discharge

SOURCE: Zhurnal prikladnoy spektroskopii, v. 5, no. 1, 1966, 118

TOPIC TAGS: electric discharge, ELECTRODE REACTION

ABSTRACT: The author describes the shape of electrodes selected for the proper separation of the channel and flare without placing an insulator in the discharge region. The shape of the electrode (Fig. 1) creates conditions at which breakdown occurs not along the short distance between the rounded segments of the electrodes, but between the protruding ridges, whose points are directed toward one side. The flares off the spikes of the electrodes are then propagated almost parallel to each other; moreover, the angle between the flares may be changed by varying the point angle of the electrode. Copper electrodes were used in the experiments and the capacitance of the condenser in the spark circuit was 1  $\mu$ f and the voltage, 10 kv. Under these conditions the copper vapor flares propagated 10–15 mm away from the electrodes. The method proposed in particular

Card 1/2

ACC NR: AP6027903

creates conditions for studying the spectrum of electrode pairs emitted by individual sectors of the flare. The method is also useful for the study of the erosion action of flares. Orig. [26] art. has: 1 figure.

PHYSICAL BASIS FOR THE METHOD USING RADIO-ACTIVE ISOTOPES. HANDBOOK FOR PRACTICAL WORK. S. M. Rezekil and V. F. Smirnov. State Publishers of Technical-Theoretical Literature. Moscow, 1966. 335p.

The book is designed for the use of engineers, chemists, biologists, and other personnel not trained in nuclear physics, to aid them in their work with radioactive indicators. The handbook explains the physical basis of the method, describes the apparatus for recording radiations, analyses conditions under which reliable measurements can be obtained, and cites the rules which must be obeyed in work using radioactive isotopes. "Review of Dr. V. I. Kristman's Book, 'Internal Diseases,'" S. M. Rayskiy, 1 p

"Med Sestra" No 9

Book is used as textbook for training nurses. It is superior in many ways to other books on the subject. However, it suffers from "academic objectivism," i.e., it does not lay sufficient stress on Soviet achievements. It should be revised so that the next edition may serve as a means of ideological education of Soviet youth and thus nurture the growth of a spirit of patriotic pride.

Inst : N. Copernicus University, Torun, Poland.

Title : A Discussion on Bilocality.

Orig Pub : Acta phys. polon., 1956, 15, No 2, 89-109

Abstract : Various arguments are collected in favor of the bilocal formulation of the theory of non-localized fields (Referat Zhur Fizika, 1956, 21863). In the first part, it is undertaken to prove that knowledge of the experimental facts, already given by Newton in his "Principles of Mechanics" and "Treatise of Optics," is sufficient to permit, with the aid of modern mathematical methods, to reproduce by purely logical means the theory of relativity and of quantum mechanics, together with the quantum field theory in their

Card 1/3

POLAND/Theoretical Physics

B-6

Abs Jour : Referat Zhur - Fizika, No 5, 1957, No 10920

modern formulations. With this, it is proposed that it is possible, without experimental verification, to select from among the tremendous number of logical possibilities exactly those that correspond to physical reality. From the logical point of view, a criticism is raised against the modern state of the theory of relativity and quantum theory and their logical relationships with each other are studied. It is stated, that for further development of physical theory, of particular importance is the group of canonical transformations. Along with the known  $\hbar$ -quantization  $[x_\mu, i\hbar d_\nu] = i\hbar \delta_{\mu\nu}$ , where  $\delta_{\mu\nu}$  is the

displacement operator, the author introduces  $\ell$ -quantization,  $[x_\mu, \ell^2 d_\nu] = \ell^2 \delta_{\mu\nu}$ , where  $\ell$  is a new universal constant.  $\ell$ -quantization is considered as quantization of space-time in contradistinction with quantization

Card 2/3

B-6

POLAND/Theoretical Physics

Abs Jour : Referat Zhur - Fizika, No 5, 1957, No 10920

of mechanical models ( $\hbar$ -quantization). The operators of the theory with  $\hbar$ -quantization are represented by matrixes  $\langle x' | A | x'' \rangle$ . The bilocal field  $\psi = \langle x' | \psi | x'' \rangle$  obeys the equations of motion  $[\delta^{\mu_n}_{\nu_m} [\sigma^m_n, \psi] =$

$\hbar^4 m^2 \delta_{\mu\nu} \psi$ , where  $1^{\mu_n} \equiv x_n$ ,  $2^{\mu_n} \equiv l^{2d}$ .

These equations are generalizations of the Klein-Gordon equations  $[2^{\mu_n}, [2^{\mu_n} \psi]] = \hbar^4 m^2 \delta_{\mu\nu} \psi$  and the locality conditions  $[1^{\mu_n}, \psi] = 0$ . A study is made

of the properties of the solutions of bilocal equations of motion. It is shown that the proper mass consists of the mechanical mass, due to the internal motion in the bilocal particle, and of the field mass. It is also shown that in the bilocal theory it is possible to obtain a spectrum of masses.

TITLE: Deformation resistance of aluminum alloys under cold pressing conditions

SOURCE: Tsvetnyye metally, no. 1, 1966, 75-78

TOPIC TAGS: cold working, metal pressing, metal deformation, deformation rate, aluminum alloy / AD1 aluminum alloy, D1 aluminum alloy

ABSTRACT: The true yield strength  $S_y$ , which is affected by changes in temperature, degree of deformation ( $\epsilon$ ), and deformation rate ( $w$ ), was studied in two typical aluminum alloys, AD1 (soft) and D1 (hard) under cold pressing conditions. In the AD1 alloy, the most pronounced increase in  $S_y$  is observed at  $w = 0.5-3.0 \text{ sec}^{-1}$  (see Fig. 1). In the D1 alloy, the effect of a tenfold increase in deformation rate (from 0.5 to 5  $\text{sec}^{-1}$ ) is even greater than in AD1 (see Fig. 2). This is due to a greater evolution of heat during deformation, and to the resultant heating up of the specimen, which causes a more marked decrease of  $S_y$ . This phenomenon is more pronounced the higher the deformation rate. It is concluded that under cold pressing conditions, the deformation rate substantially affects the strength characteristics of aluminum alloys

ORG: none

TITLE: Experience in producing cold-pressed semifinished aluminum alloy products

SOURCE: Tsvetnye metally, no 4, 1966, pp 76-77

TOPIC TAGS: aluminum alloy, cold forging, metal pressing, metal tube/AD1 aluminum alloy, AMg aluminum alloy, D1 aluminum alloy, A00 aluminum alloy, AV aluminum alloy

ABSTRACT: Cold pressing has the advantage that it dispenses with the need for the subsequent cold working of semifinished aluminum alloy products. In this connection, to determine the types of these products for which cold pressing is the most effective, rods, rectangular tubes and thin-walled irrigation pipe were experimentally cold-pressed in universal 600- and 1500-ton hydraulic presses with the aid of pre-stressed tools, on using high-molecular fatty alcohols as the lubricant. Finding: it was possible to produce in this manner, from AD1, AMg1 and D1 aluminum alloys, rods of highly precise dimensions, more precise than the dimensions of the normal hot-pressed rods. As for rectangular tubes (A00 aluminum alloy)(28.5x12.6x1.5 mm), the quality of their surface and the precision of their dimensions also were

Card 1/2

UDC: 669.715:621.986

L 36007-60

ACC NR: AP6012730

2

satisfactorily high. As for irrigation pipe (<sup>6</sup> aluminum alloy), the quality of its surface and its mechanical properties were also satisfactory. What is more, it is possible by means of cold pressing to produce irrigation pipe with wall thickness of as little as 1.5 mm whereas the minimum allowable wall thickness for hot-pressed irrigation pipe is 2-2.5 mm: this means a substantial saving in the cost of irrigation facilities. Further, in theory it is possible to reduce this wall thickness to as little as 1 mm, provided that the pipe is finned to reinforce its strength. Thus, cold pressing is a definitely workable and highly productive technique of manufacturing thin-walled tubes of relatively large diameter with a uniform lengthwise distribution of mechanical properties and acceptable geometric tolerances. TITLE: The dependence of the properties of cold-extruded semifinished products made from aluminum alloys on the billet condition

SOURCE: Metallovedeniye i termicheskaya obrabotka metallov, no. 8, 1966, 62-64

TOPIC TAGS: aluminum alloy, extrusion, extruded aluminum, mechanical property, heat treatment, cast structure, annealing, homogenization heat treatment, grain structure, metallographic examination / AD1 aluminum alloy, AV aluminum alloy, AMg aluminum alloy, D1 aluminum alloy

ABSTRACT: Optimal heat treatments were developed for aluminum alloy billets used in making cold-extruded tubes. Alloys AD1, AV, AMg, and D1 were extruded on a mechanical press into tubes having diameters of 15 × 12, 16 × 14, and 16 × 15. The original temperature of 15-20°C increased to 250-350°C after extrusion. Mechanical properties are given for cast, annealed, and homogenized billets and tubes made from each. Cast and previously extruded billets of AD1 and AMg alloys performed identically in tube extrusion; extruded AV alloy billets had better yield strength and reduction in area; and annealed D1 billets had the highest plasticity. Microstructures of cast and ex-

UDC: 620.17:669.716:621.78

Card 1/2

ACC NR: AP6028590

truded D1 billets and the semifinished tubes made from these were shown. The grain structure of tubes made from cast billets was smaller and more uniform, while those made from extruded D1 billets--large grained and elongated. Optimum quenching temperatures for cold extruded AV tubes were 515-520°C. By heating in a circulating-air pit furnace after quenching, the maximum properties were obtained after holding for 10 min; the properties did not improve if the holding time was increased to 30 min. An increase in quenching temperature from 480 to 500°C for alloy D1 resulted in raising the yield strength by 2 kg/mm<sup>2</sup>. Orig. art. has: 1 figure, 2 tables.

TITLE: Peculiarities and new trends in production of half-finished parts from sintered aluminum powder. Report presented at the seventh All Union Conference on powder metallurgy, held 12 to 14 Oct 1964 in Yerevan

SOURCE: Poroshkovaya metallurgiya, no. 12, 1965, 16-19

TOPIC TAGS: sintered aluminum powder, aluminum alloy, argon, arc welding, aluminum plating

ABSTRACT: The authors elaborate on the basic parameters of the technology of obtaining bimetallic tubes from sintered aluminum powder (SAP) material with a plating made of welded aluminum alloy. Constructive units made of such tubes may be joined by contact welding methods along the plating layer. It is shown that sintering SAP at temperatures of 600 to 620C and exposure for 20 to 50 hours (depending on the size of the sintered briquette) yield material with

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 23, 1962, 53, abstract 23B372 (Byul. nauchno-tekhn. inform. M-vo geol. i okhrany nedor SSSR, no. 2 (36), 1962, 70-71)

TEXT: A method has been developed for growing crystals of penta-erythrite  $C_5H_{12}O_4$  on a seed or in suspension. For X-ray monochromatization pentaerythrite plates, split along the (001) cleavage plane of the crystal are best. The plane (002) is reflected. An attachment for mounting the crystals in front of the X-ray tube and checking their qualities is described. The optimum reflection is obtained from crystals 1 mm thick.

TITLE: Mechanism for controlling the clamping levers of oil well devices. Class 5,  
No. 176843 [announced by Special Construction Bureau of Geophysical Device Construc-  
tion for Geology of the UkrSSR (Osoboye konstruktorskoye byuro geofizicheskogo  
priborostroyeniya glavgeologii UkrSSR)

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 24, 1965, 8-9

TOPIC TAGS: well drilling machinery, lever, pressure gage

ABSTRACT: This Author Certificate presents a mechanism for controlling the clamping levers of oil well devices, placed in a hermetically sealed chamber filled with fluid and located inside the drill-hole device. To simplify its construction and decrease the cost of the actuator, the latter is made as a hydraulic multiple action system equipped with a liquid compensator which senses the drill-hole pressure and transmits it through electromagnetically controlled distribution channels to the working piston. The piston rod is attached to the lever system, while the chamber is connected to an unfilled draining reservoir at a lower pressure than the drill-hole pressure. This design assures the return action of the system (see Fig. 1).
